

SHERWOOD®

Maintenance & Repair Manual

A COMPLETE GUIDE TO RUBBER IMPELLER PUMP

Why Service With Sherwood

The seawater pump is the heart of the marine engine, supplying a continuous water flow to maintain consistent engine temperatures. And, the #1 reason for Premature Engine Wear Is Overheating. To maintain engine performance, warranty and liability - - - insist upon the Original, Engine Tested & Engine Specified Sherwood.

Sherwood History

Sherwood beginnings date back to 1903, when William Sherwood and his friend and business partner David Buick (of General Motors fame) operated a copper brass plumbing business. They parted ways as Buick became more interested in the automobile. Sherwood then developed the plumbing accessories and beer equipment business into a foundry and machine shop, where he was sought out by Ford, the Dodge brothers, and others for the expanding auto-driven industries in Detroit, Michigan.

In the 1920s, another entrepreneur named Chris Smith helped create the inboard-powered pleasure boat industry by combining automobile engines and boat hulls. His company, Chris-Craft, incorporated William Sherwood's expertise of plumbing and custom manufacturing, as they developed the first seawater pumps for marine inboard engines.

With the advent of World War II, Sherwood became a major supplier of marine engine coolant pumps for the U.S. Navy. On June 6, 1944, a Chris-Craft built personnel carrier with a Sherwood pump was the first allied landing craft to hit Normandy beaches. During this time, Sherwood also supplied pumps to marine engines of Buda, Caterpillar, Cummins, Gray, Hercules and Packard.

Following WWI, the pleasure boating industry grew. Sherwood evolved to accommodate the exacting cooling pump needs of this growing market. Sherwood kept pace with the new engines from Chrysler, Ford and GM by continuing, expanding and developing relationships with Chris-Craft, Chrysler Marine, Crusader, and OMC.

Over the years, Sherwood seawater pumps have developed a reputation of excellence in quality. Today, as part of Pentair, the Sherwood brand has taken the history of quality designs and manufacturing to become the seawater pump of choice for many of the most prestigious engine manufactures around the world.

• Recommended Horsepower: R30G - 1/2, R50G - 3/4, R102 - 2. See Impeller Flow Curves on page 10 for Performance.

Impeller Performance

Genuine Sherwood Impellers & Impeller Kits

Patented Impeller Puller

17000A, 18000, 22000, 26000, 27000, 29000, 30000 impellers contain a patented threaded insert design. Patent No. 6,116,855.

25105 & 23631 Puller used for:

17000A, 18000, 22000, 26000, 29000, 30000

25106 & 24412 Puller used for:

27000

Impeller Kits Include:

All Gaskets, O-rings, new Technical Service Guide and Engine Specified Impeller for up to 50 Sherwood pumps.

Impeller Kits Available:

- | | |
|--------|--------|

Impeller Removal and Installation

Threaded Impellers

(17000A*, 18000, 22000, 26000, 27000, 29000, and 30000). Patent No. 6,116,855.

*17000A standard impeller in 17000K is threaded/thru-key design.

Removal

- Remove the cover.
- Insert the Sherwood puller into the threaded insert.
- Screw the puller against the shaft, lifting the impeller out of the housing or until loose.
- Twist and pull the impeller out of the pump.

Installation

- Apply a non-petroleum based lubricant to impeller (i.e. silicone or soapy water).
- Install the impeller with a twisting motion onto the shaft.
- Option: Use puller tool to push impeller into pump by loosening and lowering nut until tightens against impeller insert, then turning for installation.
- Then use a small amount of non-petroleum based lubricant to help hold the o-ring in place while replacing the cover.
- For the 17000K**, align key and keyway by rotating the impeller.

****Caution:** Replace impeller key and place the rubber cap over the key opening to prevent possible damage to the cover.

Thru-Key Design Impellers

(8000K, 10077K, 09000K, 09959K, 10615K, 15000K, 17000K*)

*17000A standard impeller in 17000K is threaded/thru-key design.

Removal

- Remove the cover.
- Twist and pull the impeller out of the pump.

Installation

- Apply a non-petroleum based lubricant to impeller (i.e. silicone or soapy water).
- For non-rock key version pumps, install the key into the shaft prior to installing the impeller.
- Install the impeller with a twisting motion onto the shaft.
- After the impeller is all the way on the shaft and into the housing, rotate the impeller to align the keyway of the shaft to the key slot on the shaft.
- Slide the impeller key into the keyway and if applicable place the rubber cap over the key opening.
- Then use a small amount of non-petroleum based lubricant to help hold the o-ring in place while replacing the cover.

Threaded Impellers

17000A Thru-Key Design

Thru-Key Impellers

To maintain engine performance, insist upon genuine Sherwood impellers.
Keep it cool with the original!

Impeller Specifications

10615K Width: 1-5/8" [41mm]

Diameter: 2-9/16" [65mm]

15000K Width: 2" [51mm]

Diameter: 2-9/16" [65mm]

09959K Width: 1-1/4" [32mm]

Diameter: 2-7/16" [62.5mm]

09000K Width: 7/8" [22mm]

Diameter: 2-7/16" [62.5mm]

10077K Width: 25/32" [20mm]

Diameter: 2-1/4" [57mm]

17000K Width: 2-7/8" [73mm]

Diameter: 3-5/16" [84mm]

Threaded/Thru-key
Insert

08000K Width: 3/4" [19mm]

Diameter: 1-9/16" [40mm]

29000K Width: 4" [102mm]

Diameter: 3-3/4" [95mm]

45° 10 Tooth Spline

18000K Width: 4" [102mm]

Diameter: 3-3/4" [95mm]

Note: 18000S is an 18000 impeller with a stainless steel insert.

30° 14 Tooth Spline

26000K Width: 3-1/8" [80mm]

Diameter: 3-3/4" [95mm]

45° 10 Tooth Spline

27000K Width: 2-7/8" (73mm)
 Diameter: 3-5/16" (84mm)
 Splined Impeller

30000K Width: 4-5/16" (110mm)
 Diameter: 4-1/2" (114mm)
 45° 10 Tooth Spline

22000K Width: 4-5/16" (110mm)
 Diameter: 4-1/2" (114mm)
 30° 14 Tooth Spline

Additional Impellers

Part #	Diameter	Width	Shaft	Keyway	Number of Vanes
10187	2-19/32" (66mm)	1-31/32" (50mm)	5/8"	3/16"	

Vane Impellers

Vane Assembly Number	Vane Description	Number of Vanes Per Set	Vane Pumps
09731	1-1/4"L x 13/16"W x 1/8"H	7 (08888)	K9615G, K9635G, K9740G
09745	1-1/4"L x 13/16"W x 1/8"H	14 (08888)	K9529G, K9820G, L9841G, L9850G, L9870G, L9875G

* Assembly includes bearings pressed onto the shaft along with the appropriate spacers, washers and retaining rings.

*** The 29000 impeller must be used with the 25112 shaft replacement. The change effectively converts the pump to a G2904X.

26 **** The 29000 impeller must be used with the 25103 shaft replacement (the major kit 25045 contains the 29000 impeller and 25103 shaft bearing assembly as well). The change effectively converts the pump to a G2903X.

* Assembly includes bearing pressed onto the shaft along with the appropriate spacers, washers and retaining rings.

** The 25115 seal kit must be used with the 25119, 25120, and 25100 shaft bearing upgrade. The change converts the pumps to a P17xxC or P2708X and the 15955 or 23799 seals will not work with these upgraded shaft/bearing assemblies.

**** The kit is fitted with 24162. In some instances the 24162 wearplate will not fit. In the P1716 and P1722 pumps, the pin hole may be too shallow and the wearplate does not lay flat against the bottom of the housing bore.

In these instances use the 18441 wearplate with the smaller pin.

09959, 10615, and 15000 G Series Technical Guide

Assembly/Disassembly Instructions

The following assembly/disassembly procedures apply to all G Series pumps. Deviations from pump to pump are primarily a result of different methods of drive and mounting.

Disassembly:

- A. Remove the screws (1) and lockwashers (2) that hold the body (3) and housing (4) together.
- B. The housing assembly including the impeller (5) can be removed from the body assembly, along with the o-ring (6), spacer plate (7) and gasket (8).
- C. Remove the woodruff key (9) from the shaft (10). If the shaft is to be used again, and if it is put in a vise, always use lead over the jaws of the vise so that the shaft is not damaged.
- D. Remove the retaining ring (11 or 15) from the shaft (impeller end). The shoulder washer (12) and seat assembly (13) can now be removed.
- E. From the drive end of the pump (pulley end, hub end, shaft end), remove retaining ring, remove pin (17), remove woodruff key (18) and loosen setscrew if used. **Note:** If the pulley (23) or hub (24) is pressed on the shaft, it will be necessary to locate a support directly between the pump body and pulley or hub as close to the shaft as possible. Press the shaft out of the pulley or hub. Make sure the body is free and not supported.
- F. For the M71, GC1, GC4 and GC5, remove the two bolts that hold the aluminum adapter onto the bearing body. Pull the adapter off of the bearing body and press the lip seal out of the adapter.
- G. Remove the large internal retaining ring (16) from the body at the end of the bearing.
- H. Support the body, and press the shaft, bearings (19), spacer (20) and retaining rings (11) out through the bearing or pulley end of the body.
- I. The seal assembly (14) is pressed into the body. It can be removed by pushing a tool through the bearing end and up against the metal or back side of the seal. **Note:** On some pumps, there is a spacer located between the pulley (hub) and bearing on the shaft. On other pumps, the bearings are positioned on the shaft with a retaining ring on each end. Support the bearings on the inner race, and push the shaft out of the bearings.

Assembly:

- A. When assembling the cam (21), put Permatex #1 on the backside of the cam and the screw (22) that retains the cam. Wipe off any Permatex that gets into the impeller cavity.
- B. Assemble a retaining ring (11) on the shaft into the second groove from the impeller end. Push the ball bearing (19) over the shaft (10). Press on the inner race of the bearing. Push the bearing up against the retaining ring. (Push the bearing on from the pulley or drive end, except for M71, GC1, GC4 and GC5 pumps). Assemble a spacer and then the second ball bearing. Assemble the second retaining ring over the shaft and up against the ball bearing, if required.
- C. There is a large internal retaining ring (16) located in the body that provides a shoulder for the bearings (approximately 1.38" from the bearing end of the body). If it has been removed, it must be inserted at this time.
- D. Press the mechanical seal (14) into the body from the impeller end. Make sure that seal is pressed in square. A tool should be used to assure proper assembly.

09959, 10615, and 15000 G Series Technical Guide *(continued)*

- E. Push the bearing and shaft assembly into the body using care not to cock the bearing. A tool is recommended that will give you uniform pressure on the bearing outer race. Lock the bearing in place with the large internal retaining ring.
- F. Assemble the seat assembly (13), shoulder washer (12) and retaining ring (11 or 15) over the shaft from the impeller end. Locate the white ceramic surface against the seal – Do not damage (scratch) the white ceramic surface of the seat, or the seal and seat assembly might leak. Lubricate the rubber part of the seat and use a tool for ease of assembly.
- G. For the M71, GC1, GC4 and GC5, press a new lip seal into the aluminum adapter (with the metal backing ring away from the engine). Replace the adapter onto the bearing body. Assemble the lockwashers and bolts to the adapter. Torque the bolts to 24 ft.-lbs.
- H. While supporting the shaft, press the pulley/gear (23) or hub (24) onto the shaft. Secure pulley/hub with pin (17) or key (18) and retaining ring or setscrew as needed.
- I. Press the woodruff key (9) into the shaft. Make sure the stainless steel key is used at this location.
- J. Assemble the impeller (5) into the housing (4). **Note:** Do not use petroleum-based fluid to lubricate the impeller.
- K. Place the o-ring (6) in the groove in the housing (4). A small dab of grease will help hold it in position until the housing to body screws are tightened. Assemble the gasket (8) and spacer plate (7) on the body (3), and line up the screw holes.
- L. Replace the lockwashers (2), and tighten the screws (1). Torque the screws to 84 in.-lbs
- M. After installation, inspect the pump seal, lip seal, body, housing and cam areas for leaks.

R Series Technical Guide

Assembly/Disassembly Instructions

The following assembly/disassembly procedures apply to all R Series pumps. Deviations from pump to pump are primarily a result of different methods of drive and mounting. Pump numbers can be found on the tag or stamped on the pedestal base of the pump.

Disassembly:

- A. Remove the screws (1) and lockwashers that hold the cover to the body (3). Pull the cover and bushing assembly (2) off the drive shaft (4).
- B. Remove the vellum gasket (5). Sherwood recommends replacing the gasket each time the pump is assembled, however, if you plan to use the same gasket, it should be submerged in water until pump is reassembled. If gasket dries, it will shrink.
- C. The impeller (6) can now be removed by using pliers and grasping a vane on one side, then the other, alternating positions and gently pulling. Make sure you have a good grip on each vane so the pliers will not slip and damage the impeller.
- D. The cam (7) can be removed by removing the screw (8) that goes down through the top of the body between the intake and discharge ports.
- E. Remove the two screws (18) and lockwashers from the bearing housing (9) on the drive shaft end of the housing. This will allow you to remove the bearing housing, seal assembly, and shaft from the body.
- F. Remove the woodruff key from the shaft. If the shaft is to be used again and if it is put in a vise, always use lead over the jaws of the vise so that the shaft is not damaged.
- G. Remove the retaining ring (10) from the shaft at the seal end. The seal (12) can now be removed from the shaft. Note how the seal and seat assembly (14) are arranged so they can be properly reassembled.
- H. For the E35, support the hub and press the shaft and housing assembly off of the hub.
- I. By removing the large internal retaining ring (11) from the bearing housing, the bearing (15) and shaft can be pressed out of the bearing housing. Support the bearing housing, and press on the shaft from the impeller end.
- J. Pumps designed without separate bearing housings may require shaft removal from opposite end depending on housing design.
- K. The seat assembly (13) is pressed into the bearing housing and can be removed by pushing a tool through the bearing end and against the rubber or backside of the seat.

Assembly:

- A. When replacing the carbon bushing (16) in the cover, care should be taken not to crack the bushing. A tool that pilots on the inside diameter and presses uniformly against the end of the bushing is recommended.
- B. When assembling the cam (7), put Permatex #1 on back side of cam and the screw (8) that retains the cam. Wipe off any Permatex that gets into the impeller cavity.
- C. Assemble a retaining ring (10) on the shaft into the second groove from the drive shaft end. Push the ball bearing (15) over the shaft (4). Press on the inner race of the bearing. Push the bearing up against the retaining ring. Assemble the second snap ring (10) over the shaft and up against the ball bearing, from the flat shaft end.
- D. Push the bearing and shaft assembly into the bearing housing (9) using care not to cock the bearing. A tool is recommended that will give you uniform pressure on the bearing outer race. Lock the bearing in place with the large internal retaining ring.
- E. For pumps without a bearing housing, assemble the seat (13) into the counter bore in the housing (3) with the ceramic facing the impeller. Push the shaft and bearing assembly into the housing. Lock the bearings in place with retaining ring (11). While supporting the shaft, press the hub onto the shaft.

R Series Technical Guide

Assembly/Disassembly Instructions

- F. From the opposite end (woodruff key end of the shaft), assemble the seat (13) over the shaft, rubber side first. Push it into the counter bore in the bearing housing. Do not damage (scratch) the white ceramic surface on the seat, or the seal and seat assembly might leak.
- G. Push the seal assembly (12) over the shaft and down against the seat. Do not damage the black carbon washer that rides against the ceramic.
- H. Assemble the third retaining ring (10) on the shaft. It will be necessary to compress the seal assembly to allow the retaining ring to enter the groove on the shaft.
- I. Press the woodruff key into the keyway in the shaft.
- J. Assemble the small gasket (17) over the pilot on the bearing housing and assemble the complete shaft, bearing, and seal assembly to the body. Use the two long screws (18) for fastening the bearing housing to the body. Torque the screws to 50 in.-lbs. for the R30G and R30G-1 or 84 in.-lbs. for the R10870G and R50G.
- K. Assemble the impeller (6) over the shaft (4). Line up the key in the shaft with the keyway in the impeller, and push the impeller into the body (3).
- L. Push the gasket (5) and cover (2) over the dowel pins, and attach the cover with the screws (1) and lockwashers. Torque the screws (1) to 50 in.-lbs. for the R30G and R30G-1 or 84 in.-lbs. for the R10870G, R50G, R102 and E35.
- M. After installation, inspect the pump seal, body, housing and cam areas for leaks.

P Series Technical Guide – 10615 Impeller

Assembly/Disassembly Instructions

The following assembly/disassembly procedures apply to many P Series pumps. Deviations from pump to pump are primarily a result of different methods of drive and mounting.

Disassembly:

- A. Remove the screws (1) and lockwashers (2) that hold the cover (3) to the housing (4).
- B. Remove the o-ring or gasket (5) from the housing.
- C. Using two pliers or an impeller puller, remove the impeller (6) from the housing. Knock the key (7) out of the shaft (8).
- D. Remove the cam screw and washer (9) from the cam (10) and pull the cam out of the housing. The wear plate (11) can now be removed from the housing.
- E. Using an external snap ring pliers, remove the retaining ring (12) that holds the seal seat in place. Slide the seal seat (13) and washer (14) off the shaft.
- F. From the drive end of the pump (pulley end or hub end) locate a support directly between the pump housing and hub (15) as close to the shaft as possible. Make sure the housing is free and not supported, and then press the shaft out of the hub.
- G. Remove the large internal retaining ring (16) from the housing at the end of the bearing.
- H. Support the housing and press the shaft, bearings (17), spacer (18), slinger (19), and retaining ring (12) out through the pulley end or hub end of the housing.
- I. The seal assembly (13) is pressed into the body. It can be removed by pushing a tool through the bearing end and up against the metal or back side of the seal.
- J. Remove the retaining ring from the shaft and bearing assembly. Support the bearings on the inner race and push the shaft out of the bearings.

Assembly:

- A. Assemble a retaining ring (12) on the shaft into the second groove from the impeller end. Push the first ball bearing (17) from the pulley or drive end of the pump over the shaft (8) and against the retaining ring by pressing on the inner race of the bearing. Assemble the spacer (18), and then push the second ball bearing on the shaft and against the spacer in the same manner the first bearing was pressed on the shaft. Slide the slinger (19) against the retaining ring (it should be positioned between the bearings and mechanical seal).
- B. Press the mechanical seal (13) into the body from the impeller end. Make sure the seal is pressed in square and that the carbon face is not scratched during assembly. A tool should be used to assure proper assembly. The carbon face is positioned toward the impeller.
- C. Push the bearing and shaft assembly into the housing (4) using care not to cock the bearing. A tool is recommended that will give you uniform pressure on the bearing outer race. Lock the bearing in place with the large internal retaining ring (16).
- D. Assemble the ceramic seat assembly (13), washer (14) and retaining ring (12) over the shaft from the impeller end. Locate the white ceramic surface against the carbon face of the seal. Warning: Do not damage (scratch) the white ceramic surface of the seat or the carbon face of the seal – minor scratches can cause the seat assembly to leak. Lubricate the rubber part of the seat with a non-petroleum fluid for ease of assembly.
- E. Support the shaft at the impeller end without contacting the mechanical seal. Press the hub (15) onto the shaft flush to the

P Series Technical Guide – 10615 Impeller

Assembly/Disassembly Instructions

ball bearings. Failure to support the shaft or placing pressure against the mechanical seal during this step will cause seal and/or bearing damage.

- F. Place the wear plate (11) in the housing. Put Permatex #1 on the backside of the cam (10) and the screw (9) that retains the cam. Wipe off any Permatex that gets into the impeller cavity. Assemble the cam by placing it into the housing and securing it with the cam screw and washer assembly. Press the woodruff key (9) into the shaft.
- G. Assemble the impeller (5) into the housing. **Note:** Do not use petroleum-based fluid to lubricate the impeller.
- H. Assemble the gasket or o-ring (5) and cover (3) on the housing. Replace the lockwashers (2) and screws (1) on the cover and torque the screws to 30-42 in-lbs on the P1016 and 50-60 in-lbs for all other pumps.
- I. After installation inspect the pump seal, housing, cam area, and cover for leaks.

17000 Series Technical Guide

Assembly/Disassembly Instructions

The following assembly/disassembly procedures apply to all 17000 Series pumps. Deviations from pump to pump are primarily a result of different methods of drive and mounting. Pump model numbers can be found stamped into the cover plate of the pump.

Disassembly:

- A. Remove the three bolts (1) and lock washers (2) from the pump cover (3). The cover and o-ring (4) are now free. The impeller end cap (5) can be pried off with a screwdriver. Normally, impellers (7) can be removed by using the 23631 or 25105 impeller puller (3/4" – 16 bolt) for the 17000 threaded impeller or by using two pair of pliers to grip two of the impeller's vanes on opposite sides of the impeller. A penetrating lubricant will help loosen a stuck impeller. Also, rotating the shaft by hand may help free the impeller. The 3/16" key (6) will also be removed at this time.
- B. Remove any pulleys or drive gears (25) from the drive shaft. For tapered shaft models (all models except P173 and P1719), it is necessary to remove the shaft nut and pull the gear or pulley with a puller. For models with pressed on gears (P173), two threaded holes are provided in the gear. An appropriate puller may be attached to these two holes to remove the gear from the shaft.
- C. Most models will be equipped with a flange adapter (24). The flange adapter is held to the pump body by two socket head cap screws (21), either 3/8" or 10mm, depending on the model. The screws are removed by using a hex socket wrench. More current models are mounted with four 8mm flange hex head bolts. The adapter is then removed. If the lip seal (23) in the adapter requires replacing, it can be pressed out at this time.
- D. The cam (8) and cam screw (9) are removed. The internal wear plate (13) will drop out. The retaining ring (10), washer (11) and seal seat (14) are then removed. Pump models P1710C, P1716C, P1722C, P1727C, P1730C, P1732C, and P17XX-04 do not utilize this retaining ring and washer. For these pumps, the seal seat can be removed in step F below.
- E. From the ball bearing end, the internal snap ring (17) must be removed on models P171 through P176, P1710 and P1732. All other models have extended bearing assemblies and are held together by means of the flanged adapter.
- F. The shaft/bearing assembly (19) is pressed out of the body from the impeller end of the housing and removed from the engine end of the pump. For pump models P1710C, P1716C, P1722C, P1727C, P1730C, P1732C, and P17XX-04, the seal seat will press off of the shaft when the shaft is forced out of the pump.
- G. On earlier models, the two external snap rings (10) are removed from the shaft (19) along with the bearing washers (12), permitting removal of bearings (20). More recent designs do not utilize the bearing washers, and they have one retaining ring in-between the ball bearings. The mechanical seal (15) may now be removed by pressing it out from the bearing side of the housing (18).

Warning: If a shaft/bearing assembly exists for the particular model that is being repaired, do not try to build the shaft/bearing assembly from the individual parts, but instead purchase the entire assembly. Due to extremely tight tolerances, special assembly procedures for this assembly must be followed to prevent galling and subsequent leakage in the oil seal area of the pump.

Reassembly:

- A. Press mechanical seal (15) into housing (18), using the seal pusher provided in the 25115 seal kit if applicable, with the grey silicon carbide or black carbon seal face toward the impeller.
- B. On all older model pumps with mounting adapters, the lip seal (23) will have to be replaced prior to replacing the flange adapter (24). Care should be taken to ensure proper alignment of the lip seal to the adapter and that the lip seal is uniformly pressed to prevent distortion. The metal backing ring of the lip seal goes toward the pump and away from the engine.
- C. Skip this step if the entire shaft/bearing assembly is available for the particular model that is being repaired. Install external snap ring (10) on shaft (19). Next, place washer (12), bearing (20), bearing spacer (16), second bearing (20) and washer (12) and secure with the second external snap ring (10). The bearings will have to be pressed on from the pulley/gear end. Note that it is extremely important to properly align the bearings to the shaft prior to the press, otherwise the possibility exists of galling the shaft in the area of the lip seal.

17000 Series Technical Guide

Warning: The new 25119 and 25120 shaft and bearing assemblies can only be used with the 25115 mechanical seal kit which utilizes a pressed on seal seat. This seal is an upgrade over the standard mechanical seal. Attempting to use the 15955 or 23799 mechanical seal with the 25119 or 25120 shaft bearing assembly or in a standard P1700 pump will damage the seal and cause a shaft leak. The 25115 mechanical seal kit CANNOT be used on the standard P1700 shaft due to the design. The 25115 mechanical seal kit can only be used in either a P1710C, P1716C, P1722C, P1727C, P1730C, P1732C, or P17XX-04 pump or with a P1700 series pump that has been upgraded with the 25119 or 25120 shaft and bearing assembly. Attempting to use the 25115 mechanical seal on an older shaft design will damage the shaft and mechanical seal which will cause a seal leak.

Note: The 25119 and 25120 shaft and bearing assemblies can be identified by the indentation machined into the shaft on the impeller end, the slightly undercut shaft in the key area which allows the seal seat to slide down the shaft to within 3/8" of the mechanical seal on the 25120, or the use of a plunged key on the 25119, or the lack of a snap ring groove between the impeller and the bearing closest to the impeller. These features are all absent on older shaft bearing versions of the shaft.

- D. Press the bearing and shaft assembly into the housing (18). In applicable pump models, replace the internal snap ring (17). The use of Loctite #262 or equivalent is recommended on the adapter bolts. The adapter (24) may be reassembled to the pump housing (18) at this time with two or four bolts (21) as applicable. Torque the adapter bolts to 18 ft-lbs.
- E. The seal seat (14) is now installed from the impeller end of the housing. The grey silicon carbide or white ceramic seat should be placed against the grey silicon carbide or black carbon seal face of the mechanical seal (15). **Caution:** Care must be taken to remove all burrs, salt buildup, and other corrosion from the keyway and seal seat area to prevent cutting the rubber cup or galling the 25115 metal seal sleeve.
1. When installing the 25115 seat with the metal sleeve (see the Warning and Note above), use the seal installation tool provided in the mechanical seal, minor and major kits, to press the seal seat (14) to the correct position on the shaft. Place the seal seat in the seal installation tool with the grey silicon carbide face away from the tool and the metal backing cup inside the tool. Slide the seal seat and tool over the shaft from the impeller end of the pump. The seal seat is pressed onto the shaft until the seal installation tool contacts the metal edge of the mechanical seal case. This metal to plastic contact between the seal edge and the plastic seal installation tool ensures the proper seal compression. The press holds the seat in place; no snap ring is used in this design.
 2. When installing the ceramic and rubber boot, a pusher should be used with a diameter only slightly greater than the shaft diameter (.80"). Soapy water or a lubricant from a seal manufacturer may be used in assembly. Oil or grease must not be used as it will prevent the rubber cup from properly gripping the shaft. The seat and cup are pressed just beyond the external/snap ring groove. The seat should be inspected to ensure that the cup did not become partially dislodged during the press procedure. The washer (11) and external snap ring (10) are then installed.
- F. The internal wear plate (13) is dropped in place, anti-rotation pin aligned with the cast slot in the bottom of the housing. The cam (8) is reinstalled and secured with the cam screw (9) and cam screw o-ring. Older model cam screws were sealed by means of a nylon washer requiring Permatex or other sealant to seal the cam screw. The cam screw should be inspected to ensure that it does not protrude below the cam. This condition is possible if the nylon seal is badly deformed or if a substitute screw is used. Should the screw protrude beneath the cam, replace it with a new screw, or grind flush. Failure to do so will result in immediate impeller damage.
- G. At this time, if applicable, press on any gears (25), pulleys, or hubs onto the shaft. While pressing on the drive mechanism, the shaft (19) must be securely supported from the impeller end and in line with the press. Failure to do so will result in either damaged bearings and/or a canted gear with excessive run out. For the base model pumps P1716, P1722, P1727, P1730 and P1731, replace the tapered gear and gear nut on the shaft. Use Loctite #262 on the gear threads and torque the nut to 50 ft-lbs. For all other tapered gear and shaft assemblies, see the applicable engine manufacturers' requirements for thread sealant and torque specifications.
- H. Install the plunged key into the shaft for pumps P1710C, P1732C, and equivalent P17XX-04 designs without the thru-key.
Note: The 1-1/2" key in the 17000K impeller kit is the plunged key.
- I. Install the impeller (7) using a non-petroleum based lubricant such as silicon or soapy water. **Note:** Do not use petroleum-based fluids as they will damage the impeller. The impeller is installed using a twisting motion. Ensure the impeller blades are bent in the same direction as upon removal. Once installed, rotate the shaft to align keyway and slide the key (6) in place (not applicable for the plunged key designs P1710C, P1732C, and equivalent P17XX-04). **Note:** The 2" key found in the 17000K is used in all models other than the designs P1710C, P1732C, and equivalent P17XX-04. Cover the key hole in the impeller insert with the rubber end plug (5). **Caution:** Failure to place the plug in place on the 17000A impeller will cause the key to walk out of the shaft keyway and damage the cover. The 17000 impeller requires that the key be placed on the shaft prior to installation.
- J. Replace the cover o-ring (4), cover (3), lock washers (2), and the cover cap screws (1). Torque the cap screws to 14 ft-lbs.
Note: If the cover is replaced with a new one, record the information on the original cover to help identify the pump for future repairs and maintenance.
- K. After installation, inspect the pump seal, lip seal, body, housing, and cam areas for leaks.

* The 25115 seal kit must be used with the 25119, 25120, and 25100 shaft bearing upgrade. The change converts the pumps to a P17xxC or P2708X and the 15955 or 23799 seals will not work with these upgraded shaft/bearing assemblies.

** Kit fitted with the 24162 wearplate. In some instances, the 24162 wearplate will not fit in the P1716 and P1722 pumps; the pin hole may be too shallow and the wearplate does not lay flat against the bottom of the housing bore. In these instances, use the 18441 wearplate with the smaller pin.

Notes:

27000 Series Technical Guide

Result of different methods of drive and mounting. Pump model numbers can be found stamped into the cover plate of the pump.

Disassembly:

- A. Remove the three bolts (1) and lockwashers (2) from the pump cover (3). Note the direction of the impeller blades upon removal. Remove the impeller (4) using the appropriate 24412 or 25106 M16 x 1.5 impeller puller. Remove the o-ring (5) from the housing (6).
- B. Remove the pulley hub (7) from the shaft using a bearing puller.
- C. Remove the cam screw (8), cam screw o-ring (9), and cam (10). The internal wear plate (11) will drop out. For the P2701-P2706 models, the retaining ring (12), washer (13) and seal seat (14) can then be removed.
- D. From the ball bearing end, the internal snap ring (15) must be removed. The shaft bearing assembly (16) is pressed out of the body from the impeller end of the housing. For pump models P2708-P2710, the mechanical seal seat (14) is now loose inside of the housing and can be removed. The mechanical seal (17) may now be pressed from the bearing side of the housing (6).
- E. Removal of the port adapters (18/19) is not necessary under normal conditions. If needed, first note the angle of each port to be able to reassemble to the correct orientation. Remove the bolts (20) and lockwashers (21) from the port adapter bracket (22). Remove and inspect the o-rings (23) for damage.
- F. Inspect the shaft for heavy fretting of the spline portion that drives the impeller. Inspect the bearings for loss of grease, corrosion, and rough rotation. If the shaft or bearings exhibit such a wear, replace the entire shaft and bearing assembly (16) listed below.

Warning: The new water seal kit 25115-SHW is designed to be used with newer pump designs (P2708-01, P2708X, P2709-01, and P2710-01) or upgraded older pump designs using the new 25100-SHW shaft/bearing assembly that facilitates the new metal sleeve water seal. The 25115-SHW metal sleeve water seal cannot be used with the previous shaft and bearing assemblies. Doing so will cause damage to the shaft and the seal.

Identifying the proper shaft for use with the 25115-SHW mechanical seal kit:

25100-SHW shaft/bearing assemblies do NOT have a retaining ring groove on the shaft in the area between the impeller and the first bearing (the bearing on the impeller end of the pump). These shaft and bearing assemblies can be used with the 25115-SHW. If a retaining ring exists between the impeller and the first bearing, do not use the 25115-SHW mechanical seal kit.

27000 Series Technical Guide *(continued)*

Reassembly:

- A. Press mechanical seal (17) into housing (6) with the grey silicon carbide face of the mechanical seal toward the impeller cavity.
- B. Press the bearing and shaft assembly (16) into the housing (6) from the pulley end of the pump. Replace the internal snap ring (15).

Warning: The new water seal kit 25115-SHW is designed to be used with newer pump designs P2708-01, P2708X, P2709-01, and P2710-01) or upgraded older pump designs using the new 25100-SHW shaft/bearing assembly that facilitates the new metal sleeve water seal. The 25115-SHW metal sleeve water seal cannot be used with the previous shaft and bearing assemblies. Doing so will cause damage to the shaft and the seal.

Identifying the proper shaft for use with the 25115-SHW mechanical seal kit:

25100-SHW shaft/bearing assemblies do NOT have a retaining ring groove on the shaft in the area between the impeller and the first bearing (the bearing on the impeller end of the pump). These shaft and bearing assemblies can be used with the 25115-SHW. If a retaining ring exists between the impeller and the first bearing, do not use the 25115-SHW mechanical seal kit.

- C. For Models P2701-P2706, the grey silicon carbide seat and rubber cup (14) is now installed from the impeller end of the housing with the grey face of the seal seat contacting the grey mechanical seal (17) face. In pressing the seal seat, a pusher should be used with a diameter only slightly greater than the shaft diameter (.80"). Soapy water or a lubricant from a seal manufacturer may be used in assembly. Oil or grease must not be used as it will prevent the rubber cup from properly gripping the shaft. The seat and cup are pressed just beyond the external/snap ring groove. The seat should be inspected to ensure that the cup did not become partially dislodged during the press procedure. The washer (13) and external snap ring (12) are then installed.
- D. For Models P2708-P2710, use the seal installation tool provided in the mechanical seal, minor and major kits, to press the seal seat (14) to the correct position on the shaft. Place the seal seat in the seal installation tool with the grey silicon carbide face away from the tool and the metal backing cup inside the tool. Slide the seal seat and tool over the shaft from the impeller end of the pump. The seal seat is pressed onto the shaft until the seal installation tool contacts the metal edge of the mechanical seal case. This metal to plastic contact between the seal edge and the plastic seal installation tool ensures the proper seal compression. Because the seal seat is pressed onto the shaft, there is no need for a snap ring to hold the seal seat in place.
- E. The internal wear plate (11) is dropped in place with the anti-rotation pin aligned with the cast slot in the bottom of the housing. Replace the cam screw o-ring (9) on the cam screw (8), then the cam (10) can be reinstalled and secured with the cam screw. The cam screw should be inspected to ensure that it does not protrude below the cam. Should the screw protrude beneath the cam, replace it with a new screw, or grind flush. Failure to do so will result in immediate impeller damage.
- F. At this time, press on the pulley hub (7). The shaft bearing assembly (16) must be securely supported from the impeller end and in line with the press. Failure to do so will result in either damaged bearings and/or a canted pulley hub with excessive run out.
- G. Install the impeller (4) using a non-petroleum based lubricant such as silicone or soapy water. **Note:** Do not use petroleum-based fluids as they will damage the impeller. The impeller is installed using a twisting motion. Ensure the impeller blades are bent in the same direction as upon removal.
- H. Replace the o-ring (5), cover (3), lockwashers (2), and three bolts (1). Torque the cap screws to 14 ft-lbs. **Note:** If the cover is replaced with a new one, record the information on the original cover to help identify the pump for future repairs and maintenance.
- I. If necessary, place the o-ring (23) in the port adapters (18/19). Slide the port adapter bracket (22) onto the ports, then replace the lockwashers (21) and bolts (20) to secure the ports to the housing. Be sure to align the ports as they were prior to removal.
- J. After installation, inspect the pump seal, lip seal, body, housing, and cam areas for leaks.

* 15955-SHW is to be only used with the original shaft and bearing assembly. The original shaft and bearing assembly has a snap ring groove between the impeller and the first ball bearing. Do not use the 15955-SHW with the 25100-SHW shaft bearing assembly designed for the pressed-on seal seat.

** When replacing the shaft bearing assembly with the 25100-SHW, the 25115-SHW mechanical seal kit must also be used. The 25100-SHW shaft and bearing assembly can be identified by the absence of the snap ring groove between the impeller and the first ball bearing. Do not use the 15955-SHW with the 25100-SHW assembly.

18000 Series Technical Guide

Assembly/Disassembly Instructions

The following assembly/disassembly procedures apply to all 18000 Series pumps. Deviations from pump to pump are primarily a result of different methods of drive and mounting. Pump numbers can be found stamped into the cover plate of the pump.

Disassembly:

- A. Remove the bolts (1) and lockwashers (2) from the cover (3).
- B. Remove the cover, quad rings (4), impeller (5), cam liner halves (6), and wearplate (7). Note the direction of the impeller blades to ensure proper replacement of the impeller during the assembly procedure. **Caution:** the pin (8) might fall out from its place between the cam liner halves. The impeller can be removed using impeller puller 23631, 25105, or a 3/4" x 16 UNF bolt.
- C. Using external snap ring pliers, remove the retaining ring (9) from the shaft.
- D. Slide the washer (10) and mechanical seal (11) off of the shaft.
- E. Remove the bolts (12) holding the body (13) to the housing (14).
- F. Slide the housing off of the shaft and body assembly.
- G. Press the seal seat (15) out of the housing.
- H. When applicable remove the drive gear assembly: while supporting the drive gear (16), remove the nut (17), nut washer (18), and key (19) from the shaft. Slide the gear off of the shaft and remove the thrust washer (20) behind the gear.
- I. Using internal snap ring pliers, remove the retaining ring (21) from the body. Remove the bearing shield (24) from the body.
- J. Press the bearing and shaft assembly (22) out of the body.
- K. Remove the lip seal (23) and washer (25) from the body.
- L. Inspect the shaft for grooving of the lip seal area and heavy fretting of the spline portion that drives the impeller. Inspect the bearings for loss of grease, corrosion, and rough rotation. If the shaft or bearings exhibit such a wear, replace the entire shaft and bearing assembly (22).

Warning: Do not try to build the shaft and bearing assembly from the individual parts, but instead purchase the entire shaft and bearing assembly. Due to extremely tight tolerances, special assembly procedures for this assembly must be followed to prevent galling of the shaft in the lip seal area.

Assembly:

- A. Replace the washer (25) then press the lip seal (23) into the pump body (13) with the metal backing ring of the lip seal toward the housing (14) and away from the engine. Care should be taken to ensure proper alignment of the lip seal to the pump body and that the lip seal is uniformly pressed to prevent distortion.
- B. Press the shaft and bearing assembly (22) into the pump body.
- C. Slide the bearing shield (24) into the pump body and against the inner bearing.
- D. Using internal snap ring pliers, install the retaining ring (21) into the body.

18000 Series Technical Guide *(continued)*

- E. Press the mechanical seal seat (15) into the housing with the white ceramic seal face or gray silicon carbide face toward the impeller. Lubricate the outside of the seat boot with a water soluble lubricant or soapy water for easier assembly. Oil or grease must not be used as it will prevent the rubber cup assembly from properly gripping the housing. The seat should be inspected to ensure that the cup did not become partially dislodged during the assembly procedure.
- F. Slide the housing over the shaft and body assembly. Apply Loctite #262 or equivalent to the bolt threads. Fasten the three bolts (12) and torque them to 25 ft-lbs.
- G. When applicable, replace the drive gear assembly. Slide the thrust washer (20) onto the outer bearing. Place the key (19) in the shaft, then slide the gear (16) on the shaft. Apply Loctite #262 or equivalent to the shaft threads. Replace the washer (18), then tighten the nut (17) onto the shaft for the G1808, G18081-01, G18082-01 and G18082X. While supporting the drive gear, torque the nut to 270 ft-lbs. For all other models, refer to applicable engine manufacturer's torque requirements. 24007 contains 2 thrust washers. The G18082-01 utilizes the 23926 washer, which is .300" thick and 1.38" diameter of solid steel. The G1808 and G18081-01 use the 22779 washer, which is dimensionally the same, except it has a step in the internal diameter.
- H. Lubricate the inner rubber portion of the mechanical seal (11) with a water soluble lubricant or soapy water and slide the seal onto the shaft, with the carbon or silicon carbide portion of the mechanical seal toward the seal seat. Oil or grease must not be used as it will prevent the mechanical seal from properly gripping the shaft.
- I. Place the washer (10) onto the shaft and against the mechanical seal (see below to identify the proper washer) and then using external snap ring pliers, install the retaining ring (9) into the groove in the shaft to compress the mechanical seal.

Seal Washer Selection

When replacing the mechanical seal, it is necessary to ensure the proper seal washer is used to avoid damage to the pump. It is recommended that all pumps be upgraded with the silicon carbide mechanical seal 23837, except for pump number G1810, G1810-01, G1810x, G1811-01, G1815-01, G1816-01, which can only be fitted with the 23512 seal. The G1814-01 and G1814x use the 24511 silicon carbide mechanical seal. Use the following to determine which washer to use:

- When using the silicon carbide mechanical seal 23837 for replacement, determine the proper spacer to use from the chart below. Silicon carbide is characterized by the charcoal gray-colored seal and seat faces, as opposed to carbon on ceramic, which would be black on white.
- Exceptions to the chart:
 - If the pump is to be fitted with the new shaft and bearing assembly listed on the chart on page 40 (24000, 24001, 24002, and 24003), use the 19866 washer. These shaft and bearing assemblies can only be used with the 23837 silicon carbide mechanical seals.
 - Replacement of the seal with the carbon on ceramic mechanical seal 19878 can only be performed on older units with the original shaft and bearing assemblies still in place. Use the 19866 spacer in such cases. Use of the 19878 seal with the current production units (G18061-01, G18071-01, and G18081-01) or with older units fitted with the new shaft and bearing assemblies will cause damage to the pump.
- J. Install the wearplate (7) with the hole in the plate lined up with the slot in the housing. Install the quad ring (4) into the housing

Pump Number	23837 Seal Spacer Number *
G1801	23840
G1804	23840
G1805	23840
G1806	23840
G18061-01	19866
G1807	23840
G18071-01	19866
G1808	23840
G18081-01	19866
G18082-01	19866
All Others**	N/A

Note: If the pump is fitted with a silicon carbide seal, it must be replaced with the 23837 silicon carbide seal to prevent damage.

**Note: The 19866 spacer is .060" thick and the 23840 is .260" thick.*

*** G1810, G1810-01, G1811-01, G1815-01, G1816-01 use the 23512 seal only. The G1814-01 and G1814X use the 24511 silicon carbide mechanical seal.*

and on top of the wearplate.

- K. Create the cam assembly by connecting the cam halves (6) together and installing the pin (8) into the cam liner. A dab of grease can be used to hold the pin in place during installation. Place the cam assembly into the housing, ensuring that the pin aligns with the slot in the housing.
- L. Insert the impeller (5) in the housing using a twisting motion. Ensure that the impeller blades are bent in the same direction as upon removal (dependent on the pump model). For ease of installation, apply a silicon lubricant to the impeller. **Caution:** Do not use a petroleum-based lubricant (petroleum product will cause damage to the impeller).

18000 Series Technical Guide *(continued)*

Vanes flipped to the left
(viewed from cover).

Models:
G1808, G18081-01,
G18082, G18082X,
G1810, G1810-01,
G1814-01, G1814X,
G1811-01 and G1816-01

Vanes flipped to the right

22000 and 30000 Series Technical Guide

Assembly/Disassembly Instructions

The following assembly/disassembly procedures apply to all G22000/G3000 Series pumps. Pump numbers can be found stamped into the cover plate of the pump.

Disassembly:

- A. Remove the bolts (1) and lockwashers (2) from the cover (3).
- B. Remove the cover and quad ring (4). Note the direction of the impeller blades to ensure proper replacement of the impeller during the assembly procedure. The impeller (5) can be removed with impeller puller 23631, 25105, or a 3/4" - 16 bolt (by screwing the bolt into the threaded impeller, the impeller is jacked out of the pump).

Caution: The pin (8) might fall out from its place when removing the cam.

- C. The cam or cam halves (6), cam anti-rotation pin, and wearplate (7) can be removed.
- D. Using external snap ring pliers, remove the retaining ring (9) from the shaft.
- E. Slide the mechanical seal (10) off of the shaft.
- F. Remove the bolts (11) and lockwashers holding the body (12) to the housing (13).
- G. Slide the housing off of the shaft and body assembly.
- H. Press the seal seat (14) out of the housing.
- I. When applicable, remove the drive gear assembly: while supporting the drive gear (15), remove the bolt (16), lockwasher (17) and thrust washer (18) from the shaft. Pull the gear off of the tapered shaft using a bearing or wheel puller.
- J. Using internal snap ring pliers, remove the retaining ring (19) from the body. For the G22012-01, G22012X, G3001-01, G3001-02 and G3001X, remove the bearing shield (20) from the body.
- K. Press the bearing and shaft assembly (21) out of the body.
- L. Remove the lip seal (22) from the body.
- M. Inspect the shaft for grooving of the lip seal area and heavy fretting of the spline portion that drives the impeller. Inspect the bearings for loss of grease, corrosion and rough rotation. If the shaft or bearings exhibit such a wear, replace the entire shaft and bearing assembly (21) listed on page 51.

22000 and 30000 Series Technical Guide *(continued)*

Warning: Do not try to build the shaft and bearing assembly from the individual parts, but instead purchase the entire shaft and bearing assembly listed on this page. Due to tight tolerances, special assembly procedures for this assembly must be followed to prevent galling of the shaft in the lip seal area.

Assembly:

- A. The lip seal (22) should be pressed in the body (12) with the metal backing ring of the lip seal toward the housing (13) and away from the engine.

Caution: For the G22012-01, G22012X, G3001-01, G3001-02 and G3001X, when pressing the lip seal in the body from the impeller end, the lip seal should be pressed 0.065" plus/minus 0.010" past the furthest bearing location. See detailed illustration. This position is critical to the performance of the oil seal since it needs to be placed slightly further than the bearing, but not as far as the beginning of the taper. Failure to place the seal at this location will cause the lip seal to contact the tapered portion of the shaft which will cause premature lip seal wear. Care should also be taken to ensure proper alignment of the lip seal to the pump body and that the lip seal is uniformly pressed to prevent distortion.

Close-up Drawing of Lip Seal Area

- B. Press the shaft and bearing assembly (21) into the pump body.
For the G22012-01, G22012X, G3001-01, G3001-02 and G3001X, ensure that the lip seal will not wear on the tapered portion of the shaft (see Caution above). Replace the slinger (23) on the shaft between the mechanical seal position and the bearings.
- C. For the G22012-01, G22012X, G3001-01, G3001-02, G3001X, slide the bearing shield (20) into the pump body and against the inner bearing.
- D. Using internal snap ring pliers, install the retaining ring (19) into the body.
- E. Press the mechanical seal seat (14) into the housing (13) with the gray silicon carbide face toward the impeller. Lubricate the outside of the seat boot with a water soluble lubricant or soapy water for easier assembly. Oil or grease must not be used as it will prevent the rubber cup assembly from properly gripping the housing. The seat should be inspected to ensure that the cup did not become partially dislodged during the assembly procedure.
- F. Slide the housing over the shaft and body assembly. Fasten the four bolts (11) and lockwashers, and torque them to 12-16 ft-lbs.
- G. Replace the drive gear assembly. Slide the gear (15) on the shaft. Place the thrust washer (18) on the gear and against the shaft. Place the lockwasher (17) on the bolt (16), and then apply Loctite #262 or equivalent to the bolt. Fasten the bolt to the shaft and torque it to 36 ft-lbs.
- H. Lubricate the internal rubber portion of the mechanical seal (10) with a water soluble lubricant or soapy water and slide the seal onto the shaft with the silicon carbide portion of the mechanical seal toward the seal seat. Oil or grease must not be used as it will prevent the mechanical seal from properly gripping the shaft.
- I. Using external snap ring pliers, replace the retaining ring (9) on the shaft.
- J. Install the pin (8) into the housing.
- K. Install the wear plate (7) with the hole in the plate aligned with the pin in the housing.
- L. Place the cam (6) in the housing. For the plastic cam halves, create the cam assembly by connecting the cam halves (6) together. Align the hole in the cam with the pin in the housing and ensure the anti-rotation pin is in place after the cam is fully installed.
- M. Insert the impeller (5) in the housing using a twisting motion. Ensure that the impeller blades are bent in the same direction as upon removal (counterclockwise when viewed from the cover). For ease of installation, apply a silicon lubricant to the impeller.
- Caution:** DO NOT USE A PETROLEUM-BASED LUBRICANT (petroleum product will cause damage to the impeller).
- N. Insert the quad ring (4) into the groove, install the cover (3) on the housing, and then fasten the lockwashers (2) and bolts (1). Torque the cover bolts to 5-8 ft-lbs.
- O. After installation, inspect the seal, body, housing and cover for leaks.

26000 Series Technical Guide

Disassembly:

Note: It may not be necessary to perform the entire disassembly procedure for the intermediate and minor kits.

- A. Remove the bolts (1) and lockwashers (2) from the cover (3).
- B. Remove the cover, o-ring (4), and impeller (5), using puller number 23631, 251055, or 3/4" x 16 UNF bolt. Note the direction of the impeller blades to ensure proper replacement of the impeller during the assembly procedure.
- C. When applicable, remove the cam screw (6) and cam screw o-ring (7) from the cam. The cam (8) and wearplate (9) can now be taken out of the housing.
- D. For the G2603, G2604 and G2605 pump models with integrated cam designs, remove the two wearplate flat head screws (28) holding the wearplate in place.
- E. Using external snap ring pliers, remove the retaining ring (10) from the shaft.
- F. Slide the washer (11) and mechanical water seal (12) off of the shaft.
- G. Remove the bolts (13) holding the body (14) to the housing (15).
- H. Slide the housing off of the shaft and body assembly.
- I. Press the seal seat (16) out of the housing.
- J. Remove the drive gear assembly. While supporting the drive gear (17), remove the nut (18) from the shaft.
- K. Using internal snap ring pliers, remove the retaining ring (19) from the body.
- L. Press the bearing and shaft assembly (20) out of the body.
- M. Remove the lip seal (21) and o-ring (22) from the body.
- N. Inspect the shaft for grooving of the lip seal area and heavy fretting of the spline portion that drives the impeller. Inspect the bearings for loss of grease, corrosion and rough rotation. If the shaft or bearings exhibit such a wear, replace the entire shaft and bearing assembly (20).

26000 Series Technical Guide *(continued)*

Assembly:

Warning: Do not try to build the shaft and bearing assembly from the individual parts, but instead purchase the kit with entire shaft and bearing assembly. Special assembly procedures for this assembly must be followed to prevent galling of the shaft in the lip seal and mechanical seal area, which could cause premature seal leaks.

- A. Replace the o-ring (22) in the pump body (14), then press the lip seal (21) in place with the metal backing ring of the lip seal toward the housing (15) and away from the engine, until it is flush with the body surface. Care should be taken to ensure proper alignment of the lip seal to the pump body and that the lip seal is uniformly pressed to prevent distortion.
- B. Press the shaft and bearing assembly (20) into the pump body. Preferably, use a sleeve or piece of tubing, slightly bigger than the shaft (25mm) or about an 1" opening, to push against the inner race of the ball bearing.
- C. Using internal snap ring pliers, install the retaining ring (19) into the body. Then slide the slinger (23) onto the impeller end of the shaft to about 1/8" away from the bearings.
- D. Press the mechanical seal seat (15) into the housing with the gray silicon carbide face toward the impeller. Lubricate the out side of the seat boot with a water-soluble lubricant or soapy water for easier assembly. Oil or grease must not be used, as it will prevent the rubber cup assembly from properly gripping the housing. The seat should be inspected to ensure that the cup did not become partially dislodged during the assembly procedure.
- E. Slide the housing (15) over the shaft and body assembly. Use Loctite® Primer and Loctite® 262 or equivalent on the body to housing bolts. Fasten the three bolts (13) and torque them to 18 ft-lbs.
- F. When applicable, replace the drive gear assembly. Use Loctite® Primer and Loctite® 262 or equivalent on the gear nut. Slide the gear (17) on the shaft, and then tighten the nut (18) onto the shaft. While supporting the drive gear, torque the nut to 130-140 ft-lbs.
- G. Lubricate the inner rubber portion of the mechanical water seal (12) with a water soluble lubricant or soapy water and slide the seal onto the shaft, with the silicon carbide portion of the mechanical water seal (12) toward the seal seat (16).
Note: The two mating surfaces must be the gray silicon carbide portion of the seal to the gray silicon carbide portion of the seal seat. Oil or grease must not be used to prevent the mechanical seal from properly gripping the shaft.
- H. Place the washer (11) onto the shaft and then using external snap ring pliers, install the retaining ring (10) into the groove in the shaft to compress the mechanical seal.
- I. Install the wearplate (9) with the anti-rotation tab into the recess in the housing.
- J. For the G2603, G2604 and G2605 pump models with integrated cam designs, apply Loctite® 242 to the wearplate flat head screw threads (28), replace the two screws to secure the wear plate, and torque them to 50 in-lbs.
- K. When applicable, replace the cam (8) in the housing. Place the cam screw o-ring (7) onto the cam screw (6) and then fasten the cam screw in place.
- L. Insert the impeller (5) in the housing using a twisting motion. Ensure that the impeller blades are bent in the same direction as upon removal. For ease of installation, apply a silicon lubricant to the impeller. **Caution:** Do not use a petroleum-based lubricant (petroleum product will cause damage to the impeller).
- M. Insert the O-ring (4) into the groove, install the cover (3) on the housing, and then fasten the lockwashers (2) and bolts (1) to 8 ft-lbs. torque.
- N. If necessary to replace the port elbow, slide the port (24) through the bracket (25). Replace the o-ring (27). Fasten the lockwashers and bolts (26) through the port bracket to the housing and torque to 12 ft-lbs.
- O. After installation, inspect the seals, housing, body and cam areas for leaks.

29000 Series Technical Guide

The following assembly/disassembly procedures apply to all 29000 Series pumps. Deviations from pump to pump are primarily a result of different methods of drive and mounting. Pump numbers can be found stamped into the cover plate of the pump.

Disassembly:

- A. Remove the bolts (1) and lockwashers (2) from the cover (3).
- B. Remove the cover, quad rings (4), impeller (5), cam liner halves (6), and wearplate (7). Note the direction of the impeller blades to ensure proper replacement of the impeller during the assembly procedure. Caution: the pin (8) might fall out from its place between the cam liner halves. The impeller can be removed using impeller puller 23631, 25105, or a 3/4" x 16 UNF bolt.
- C. Using external snap ring pliers, remove the retaining ring (9) from the shaft.
- D. Slide the washer (10) and mechanical seal (11) off of the shaft.
- E. Remove the bolts (12) holding the body (13) to the housing (14).
- F. Slide the housing off of the shaft and body assembly.
- G. Press the seal seat (15) out of the housing.
- H. When applicable remove the drive gear assembly: while supporting the drive gear (16), remove the nut (17), nut washer (18), and key (19) from the shaft. Slide the gear off of the shaft and remove the thrust washer (20) behind the gear.
- I. Using internal snap ring pliers, remove the retaining ring (21) from the body. Remove the bearing shield (24) from the body.
- J. Press the bearing and shaft assembly (22) out of the body.
- K. Remove the lip seal (23) and washer (25) from the body.
- L. Inspect the shaft for grooving of the lip seal area and heavy fretting of the spline portion that drives the impeller. Inspect the bearings for loss of grease, corrosion, and rough rotation. If the shaft or bearings exhibit such a wear, replace the entire shaft and bearing assembly (22) listed on page 57.

Warning: Do not try to build the shaft and bearing assembly from the individual parts, but instead purchase the entire shaft and bearing assembly listed below. Due to extremely tight tolerances, special assembly procedures for this assembly must be followed to prevent galling of the shaft in the lip seal area.

Assembly:

- A. Replace the washer (25) then press the lip seal (23) into the pump body (13) with the metal backing ring of the lip seal toward the housing (14) and away from the engine. Care should be taken to insure proper alignment of the lip seal to the pump body and that the lip seal is uniformly pressed to prevent distortion.
- B. Press the shaft and bearing assembly (22) into the pump body.

Preventative Maintenance and Inspection

Maintenance Schedule	Pleasure Boating (Low Hours)		Commercial/Fishing Use (High Hours)	
	Light Duty	Severe Duty (High RPM, Silt or Sand)	Heavy Duty	Severe Duty (High RPM, Silt or Sand)
Impeller Kit	Every year	6 - 12 months	6 - 12 months	3 - 6 months
Minor Kit	2 years	Every year	Every year	6 months
Major Kit	4 years	2 years	2 years	Every year

* See pages 16-31 for Repair Kit Part Numbers.

The #1 reason for premature engine wear is overheating.

To maintain engine performance, insist upon genuine Sherwood impellers and service kits.

Recommended inspection to be performed at any service interval:

- Impeller Inspect for cracks or tears. Also, inspect for excessive abrasion of vane ends.
Replace annually, or if any of the conditions exist, as in the picture.
- Wear Plate Inspect for wear, flatness, and pin for fatigue.
Replace at major pump rebuild or if wear is evident to maintain pump flow and suction performance.
- Cam Replace at minor or major pump rebuild or if pitting/wear is evident.
- Cover Replace at major pump rebuild or if wear exists to maintain pump flow and suction performance.
- Mechanical Seal Replace at minor and major pump rebuild or if leaking.
- Lip Seal Replace at major pump rebuild or if leaking.
- Shaft Inspect for wear in area of lip seal and rubber impeller. Grooving of lip seal area or heavy fretting of the impeller end shaft will require shaft replacement.
- Bearing Inspect for loss of grease, corrosion or rough rotation. Replace at major pump rebuild.

Sherwood Tech Tips

To maintain best engine performance and to prolong engine life - replace your impeller annually.

Three tips to help you install your new impeller:

- Use a non-petroleum based lubricant (silicon or soapy water) to help slide the impeller into the housing.
- Install the impeller with a twisting motion onto the shaft. Never force an impeller onto the shaft. The impeller must be able to move freely on the shaft to properly prime and function.
- Use a small amount of non-petroleum based lubricant to help hold the o-ring when replacing the cover.

Proper storage of the impellers during a prolonged lay-up can help maintain the life of the impeller. Remove the impeller from the housing and store in a cool, dark place. This will avoid the following:

- Copper bonding of the impeller to the housing
- Ultraviolet deterioration
- Vanes “setting” into position as stored in the housing

How Does a Rubber Impeller Pump Work?

1 A self-priming vacuum is created as the flexible impeller vanes straighten upon leaving the cam, drawing liquid into the pump.

2 The rotating impeller carries liquid from the inlet to the outlet port. As a consequence of their design, flexible impeller pumps can pass fairly large solids.

3 When the flexible impeller vanes regain contact with the cam, they bend and the liquid is discharged from the pump in a uniform flow. Liquids can be pumped in the opposite direction by reversing the rotation of the pump.

Which is my inlet and which is my outlet port?

If you locate the cam and know which way the pump is rotating, you can figure out which port is which.

Cam (Held in place with single screw in-between the ports)

Integrated Cam with no screw (The smallest span between the ports is where the cam is located.)

Cam (Held in place with single screw in-between the ports)

Clockwise Rotation
